**Built to demonstrate a real
*content lifecycle.***

Inkwell is a final web development project: a self-contained CMS-style blog platform covering creation, editing, organization, and reading – without a backend server.

Write & edit

A distraction-free editor with a lightweight formatting toolbar, live word count, and reading-time estimate.

Organize & find

Six categories, instant client-side search across titles, authors, and excerpts, and category landing pages.

Publish & manage

Draft and published states, likes, deletion with confirmation – the full lifecycle of a piece of content.

— UNDER THE HOOD

Stack & approach

No frameworks, no build step – vanilla HTML, CSS and JavaScript with a small client-side router and `localStorage` standing in for a database, so the whole CMS lifecycle works without a backend.

HTML5

CSS3 (Grid + Flexbox)

Vanilla JavaScript

localStorage persistence

Client-side routing

Responsive design
